

Technical Troubleshooting Manual

NovaTech Solutions — Technical Support

Version	v4.2	Effective Date	2025-03-01
Department	Customer Operations	Last Review	2025-03-01

1. API Issues

1.1 HTTP 401 — Unauthorized

Cause: API key is missing, malformed, or has been revoked.

- Verify the key is included in the Authorization header: Authorization: Bearer .
- Regenerate the API key at Portal > Developer > API Keys.
- Check that the key has not been rotated — old keys are invalidated on rotation.
- Ensure there are no trailing spaces or newline characters in the key string.

1.2 HTTP 403 — Forbidden

Cause: API key exists but lacks the required scope/permission.

- Check the scopes assigned to your API key at Portal > Developer > API Keys > Edit.
- Ensure the endpoint requires a scope your key includes (e.g., 'data:write').
- For enterprise endpoints, verify your plan includes API access.
- Contact support if you need to upgrade API scopes.

1.3 HTTP 429 — Rate Limited

Cause: Request volume exceeded the plan's rate limit.

Plan	Requests/Min	Requests/Day	Burst Allowance
Basic	60	5,000	100 for 10 sec
Pro	300	50,000	500 for 10 sec
Enterprise	Custom	Custom	Custom

- Implement exponential backoff with retry-after header value.
- Cache responses where possible to reduce redundant API calls.
- Contact sales to upgrade your plan for higher limits.

1.4 HTTP 500 — Internal Server Error

Cause: Server-side issue. If the error persists beyond 5 minutes:

- Check the NovaTech Status Page at status.novatech.io.
- Include the `request_id` from the response header when contacting support.
- Do not retry in a tight loop — wait at least 30 seconds between retries.

2. Authentication & Account Access

2.1 Cannot Log In

- Confirm the email address matches the registered account email.
- Try 'Forgot Password' — reset link is valid for 30 minutes.
- Clear browser cache and cookies, then retry.
- Disable VPN if using one — geo-restrictions may apply.
- Check if the account is locked (5+ failed attempts trigger a 30-min lockout).
- If SSO is configured, contact your organization's IT admin.

2.2 Two-Factor Authentication (2FA) Issues

- Ensure your device's clock is synced — TOTP codes are time-sensitive.
- Use the backup codes provided during 2FA setup.
- If backup codes are lost, contact support for identity verification.
- Support can disable 2FA after verifying identity through a video call.

3. Billing & Payment Technical Issues

3.1 Invoice Not Generated

Invoices are auto-generated within 5 minutes of payment. If not visible in Portal > Billing > Invoices after 30 minutes, click 'Regenerate Invoice'. If still absent, contact billing support with the transaction ID from your bank.

3.2 Subscription Status Shows 'Inactive' After Payment

- Allow up to 15 minutes for payment webhook processing.
- Log out and back in to refresh account status.
- Check Portal > Billing > Payment History for payment confirmation.
- If payment is listed but status is still inactive, contact tech support.

4. Integration Issues

4.1 Webhook Not Firing

- Verify the webhook URL is correct and publicly accessible.
- Check that your server returns HTTP 200 within 10 seconds.
- Review webhook logs at Portal > Developer > Webhooks > Event Log.
- NovaTech retries failed webhooks up to 5 times with exponential backoff.
- Whitelist NovaTech's IP ranges: 103.21.244.0/22, 198.41.128.0/17.

5. Performance Issues

5.1 Slow API Response Times

Expected response times: P50 < 200ms, P95 < 800ms, P99 < 2000ms. If experiencing consistent latency above these thresholds:

- Use the nearest regional endpoint for your geography.
- Enable gzip compression in request headers: Accept-Encoding: gzip.
- Reduce payload size by using field selection parameters.
- Contact support with your account ID for server-side investigation.
